

"Traveling wave solutions of combustion in a narrow channel"

Hirofumi Izuhara (Miyazaki University, Japan)

It is reported that combustion in a narrow channel shows a variety of char patterns depending on the airflow rate. In this talk, we consider a mathematical model which describes the combustion experiment, and numerically study the existence of traveling wave solution in one space dimension. In addition, we investigate the instability of its planar combustion wave which is the onset of the variety of char patterns.
